The longtable package*

David Carlisle[†]

2000/10/22

Abstract

This package defines the longtable environment, a multi-page version of tabular.

List of Tables

1	An optional table caption (used in the list of tables)	2
2	A floating table	4
3	A difficult \multicolumn combination: pass 1	6
4	A difficult \multicolumn combination: pass 2	6
5	A difficult \multicolumn combination: pass 3	6
6	A difficult \multicolumn combination: pass 4	6
7	A summary of longtable commands	9

1 Introduction

longtable

The longtable package defines a new environment, longtable, which has most of the features of the tabular environment, but produces tables which may be broken by TEX's standard page-breaking algorithm. It also shares some features with the table environment. In particular it uses the same counter, table, and has a similar \caption command. Also, the standard \listoftables command lists tables produced by either the table or longtable environments.

The following example uses most of the features of the longtable environment. An edited listing of the input for this example appears in Section 8.

Note: Various parts of the following table will **not** line up correctly until this document has been run through IATEX several times. This is a characteristic feature of this package, as described below.

|--|--|

^{*}This file has version number v4.10, last revised 2000/10/22.

[†]The new algorithm for aligning 'chunks' of a table used in version 4 of this package was devised coded and documented by David Kastrup, dak@neuroinformatik.ruhr-uni-bochum.de.

2 Chunk Size

LTchunksize

In order to TEX multi-page tables, it is necessary to break up the table into smaller chunks, so that TEX does not have to keep everything in memory at one time. By default longtable uses 20 rows per chunk, but this can be set by the user, with e.g., \setcounter{LTchunksize}{10}.³ These chunks do not affect page breaking, thus if you are using a TEX with a lot of memory, you can set LTchunksize to be several pages of the table. TEX will run faster with a large LTchunksize.

 $^{^3\}mathrm{You}$ can also use the plain TeX syntax \LTchunksize=10.

 Page 3	

¹This is a footnote.

²longtable takes special precautions, so that footnotes may also be used in 'p' columns.

longtable.sty

A	tabular	environment
within	a floating	table

Table 2: A floating table

However, if necessary, longtable can work with LTchunksize set to 1, in which case the memory taken up is negligible. Note that if you use the commands for setting the table head or foot (see below), the LTchunksize must be at least as large as the number of rows in each of the head or foot sections.

This document specifies \setcounter{LTchunksize}{10}. If you look at the previous table, after the first run of LATEX you will see that various parts of the table do not line up. LATEX will also have printed a warning that the column widths had changed. longtable writes information onto the .aux file, so that it can line up the different chunks. Prior to version 4 of this package, this information was not used unless a \setlongtables command was issued, however, now the information is always used, using a new algorithm⁴ and so \setlongtables is no longer needed. It is defined (but does nothing) for the benefit of old documents that use it.

3 Captions and Headings

\endhead

\endfirsthead

\endfoot \endlastfoot of every page (under the headline, but before the other lines of the table). The lines are entered as normal, but the last \\ command is replaced by a \endhead command. If the first page should have a different heading, then this should be entered in the same way, and terminated with the \endfirsthead command. The LTchunksize should be at least as large as the number of rows in the heading. There are also \endfoot and \endlastfoot commands which are used in the same way (at the start of the table) to specify rows (or an \hline) to appear at the bottom of each page. In certain situations, you may want to place lines which logically belong in the table body at the end of the firsthead, or the beginning of the lastfoot. This helps to control which lines appear on the first and last page of the table.

At the start of the table one may specify lines which are to appear at the top

\caption

The \caption{...} command is essentially equivalent to \multicolumn{n}{c}{\parbox{\LTcapwidth}{...}}

where n is the number of columns of the table. You may set the width of the caption with a command such as \setlength{\LTcapwidth}{2in} in the preamble of your document. The default is 4in. \caption also writes the information to produce an entry in the list of tables. As with the \caption command in the figure and table environments, an optional argument specifies the text to appear in the list of tables if this is different from the text to appear in the caption. Thus the caption for table 1 was specified as \caption[An optional table caption (used in the list of tables)]{A long table\label{long}}.

You may wish the caption on later pages to be different to that on the first page. In this case put the \caption command in the first heading, and put a subsidiary caption in a \caption[] command in the main heading. If the optional argument to \caption is empty, no entry is made in the list of tables. Alternatively, if

⁴Due to David Kastrup.

	longtable.sty	
--	---------------	--

you do not want the table number to be printed each time, use the \caption* command.

The captions are set based on the code for the article class. If you have redefined the standard \@makecaption command to produce a different format for the captions, you may need to make similar changes to the longtable version, \LT@makecaption. See the code section for more details.

A more convenient method of customising captions is given by the caption(2) package, which provides commands for customising captions, and arranges that the captions in standard environments, and many environments provided by packages (including longtable) are modified in a compatible manner.

You may use the \label command so that you can cross reference longtables with \ref. Note however, that the \label command should not be used in a heading that may appear more than once. Place it either in the firsthead, or in the body of the table. It should not be the first command in any entry.

4 Multicolumn entries

The \multicolumn command may be used in longtable in exactly the same way as for tabular. So you may want to skip this section, which is rather technical, however coping with \multicolumn is one of the main problems for an environment such as longtable. The main effect that a user will see is that certain combinations of \multicolumn entries will result in a document needing more runs of LATEX before the various 'chunks' of a table align.

The examples in this section are set with LTchunksize set to the minimum value of one, to demonstrate the effects when \multicolumn entries occur in different chunks.

Consider Table 3. In the second chunk, longtable sees the wide multicolumn entry. At this point it thinks that the first two columns are very narrow. All the width of the multicolumn entry is assumed to be in the third column. (This is a 'feature' of TeX's primitive \halign command.) longtable then passes the information that there is a wide third column to the later chunks, with the result that the first pass over the table is too wide.

If the 'saved row' from this first pass was re-inserted into the table on the next pass, the table would line up in two passes, but would be much two wide.

The solution to this problem used in Versions 1 and 2, was to use a \kill line. If a line is \killed, by using \kill rather than \\ at the end of the line, it is used in calculating column widths, but removed from the final table. Thus entering \killed copies of the last two rows before the wide multicolumn entry would mean that \halign 'saw' the wide entries in the first two columns, and so would not widen the third column by so much to make room for the multicolumn entry.

In Version 3, a new solution was introduced. If the saved row in the .aux file was not being used, longtable used a special 'draft' form of \multicolumn, this modified the definition, so the spanning entry was never considered to be wider than the columns it spanned. So after the first pass, the .aux file stored the widest normal entry for each column, no column was widened due to \spanned columns. By default longtable ignored the .aux file, and so each run of IATEX was considered a first pass. Once the \setlongtables declaration was given, the saved row in the .aux file, and the proper definition of \multicolumn were

\kill

multicolumn 1–2		3	
wide 1	2	3	

...... longtable.sty

used. If any \multicolumn entry caused one of the columns to be widened, this information could not be passed back to earlier chunks, and so the table would not correctly line up until the third pass. This algorithm always converged in three passes as described above, but in examples such as the ones in Tables 3–6, the final widths were not optimal as the width of column 2, which is determined by a \multicolumn entry was not known when the final width for column 3 was fixed, due to the fact that both \multicolumn commands were switched from 'draft' mode to 'normal' mode at the same time.

Version 4 alleviates the problem considerably. The first pass of the table will indeed have the third column much too wide. However, on the next pass longtable will notice the error and reduce the column width accordingly. If this has to propagate to chunks before the \multicolumn one, an additional pass will, of course, be needed. It is possible to construct tables where this rippling up of the correct widths taks several passes to 'converge' and produce a table with all chunks aligned. However in order to need many passes one needs to construct a table with many overlapping \multicolumn entries, all being wider than the natural widths of the columns they span, and all occuring in different chunks. In the typical case the algorithm will converge after three or four passes, and, the benefits of not needing to edit the document before the final run to add \setlongtables, and the better choice of final column widths in the case of multiple \multicolumn entries will hopefully more than pay for the extra passes that may possibly be needed.

So Table 3 converges after 4 passes, as seen in Table 6.

You can still speed the convergence by introducing judicious \kill lines, if you happen to have constellations like the above.

If you object even to LATEX-ing a file twice, you should make the first line of every longtable a \kill line that contains the widest entry to be used in each column. All chunks will then line up on the first pass.

5 Adjustment

The optional argument of longtable controls the horizontal alignment of the table. The possible options are [c], [r] and [1], for centring, right and left adjustment, respectively. Normally centring is the default, but this document specifies

\LTleft \LTright

```
\setlength\LTleft\parindent \setlength\LTright\fill
```

in the preamble, which means that the tables are set flush left, but indented by the usual paragraph indentation. Any lengths can be specified for these two parameters, but at least one of them should be a rubber length so that it fills up the width of the page, unless rubber lengths are added between the columns using the **\extracolsep** command. For instance

	longtable.sty
--	---------------

6 Changes

This section highlights the major changes since version 2. A more detailed change log may be produced at the end of the code listing if the ltxdoc.cfg file specifies

\AtBeginDocument{\RecordChanges} \AtEndDocument{\PrintChanges}

Changes made between versions 2 and 3.

- The mechanism for adding the head and foot of the table has been completely rewritten. With this new mechanism, longtable does not need to issue a \clearpage at the start of the table, and so the table may start half way down a page. Also the \endlastfoot command which could not safely be implemented under the old scheme, has been added.
- longtable now issues an error if started in the scope of \twocolumn, or the multicols environment.
- The separate documentation file longtable.tex has been merged with the package file, longtable.dtx using Mittelbach's doc package.
- Support for footnotes has been added. Note however that \footnote will not work in the 'head' or 'foot' sections of the table. In order to put a footnote in those sections (e.g., inside a caption), use \footnotemark at that point, and \footnotetext anywhere in the table body that will fall on the same page.
- The treatment of \multicolumn has changed, making \kill lines unnecessary, at the price of sometimes requiring a third pass through LATEX.
- The \newpage command now works inside a longtable.

Changes made between versions 3 and 4.

- A new algorithm is used for aligning chunks. As well as the widest width in each column, longtable remembers which chunk produced this maximum. This allows it to check that the maximum is still achieved in later runs. As longtable can now deal with columns shrinking as the file is edited, the \setlongtables system is no longer needed and is disabled.
- An extra benefit of the new algorithm's ability to deal with 'shrinking' columns is that it can give better (narrower) column widths in the case of overlapping \multicolumn entries in different chunks than the previous algorithm produced.
- The 'draft' multicolumn system has been removed, along with related commands such as **\LTmulticolumn**.
- The disadvantage of the new algorithm is that it can take more passes. The theoretical maximum is approximately twice the length of a 'chain' of columns with overlapping \multicolumn entries, although in practice it usually converges as fast as the old version. (Which always converged in three passes once \setlongtables was activated.)
- * and \nopagebreak commands may be used to control page breaking.

7 Summary

Table 7: A summary of longtable commands

Parameters

	Parameters		
\LTleft	Glue to the left of the table.	(\fill)	
\LTright	Glue to the right of the table.	(\fill)	
\LTpre	Glue before the table.	$(\verb \bigskipamount)$	
\LTpost	Glue after the table.	(\bigskipamount)	
\LTcapwidth	The width of a parbox containing the caption.	(4in)	
LTchunksize	The number of rows per chunk.	(20)	
Opti	onal arguments to \begin{longtable}		
none	Position as specified by \LTleft and \LTright	t.	
[c]	Centre the table.		
[1] Place the table flush left.			
[r]	Place the table flush right.		
	Commands to end table rows		
//	Specifies the end of a row		
$\backslash \backslash [\langle dim \rangle]$	Ends row, then adds vertical space (as in the tab		
*	The same as \\ but disallows a page break aft	er the row.	
\tabularnewline	Alternative to \\ for use in the scope of \ragge	${ t dright} \ { t and} \ { t similar}$	
	commands that redefine $\setminus \setminus$.		
\kill	Row is 'killed', but is used in calculating widtl	hs.	
\endhead	Specifies rows to appear at the top of every pa	age.	
\endfirsthead Specifies rows to appear at the top the first page.			
\endfoot Specifies rows to appear at the bottom of every page.			
\endlastfoot	Specifies rows to appear at the bottom of the	last page.	
	longtable caption commands		
$\colon{caption{\langle caption \rangle}}$	Caption 'Table ?: $\langle caption \rangle$ ', and a ' $\langle caption \rangle$ ' tables.	entry in the list of	
$\verb \caption[\langle lot \rangle] \{ \langle caption \rangle \}$	Caption 'Table ?: $\langle caption \rangle$ ', and a ' $\langle lot \rangle$ ' e tables.	ntry in the list of	
$\epsilon[]{\langle caption \rangle}$	Caption 'Table ?: $\langle caption \rangle$ ', but no entry in t	the list of tables.	
$\colon{*}{\langle caption \rangle}$	Caption ' $\langle caption \rangle$ ', but no entry in the list of		
Com	mands available at the start of a row		
\pagebreak	Force a page break.		
$\parbox{pagebreak}[\langle val \rangle]$	A 'hint' between 0 and 4 of the desirability of	a break.	
\nopagebreak	Prohibit a page break.		
\n	A 'hint' between 0 and 4 of the undesirability	of a break.	
\newpage	Force a page break.		
Footno	ote commands available inside longtable		
\footnote	Footnotes, but may not be used in the table h	ead & foot.	
\footnotemark	Footnotemark, may be used in the table head	& foot.	
\footnotetext	Footnote text, use in the table body.		
	Setlongtables		
\setlongtables	Obsolete command. Does nothing now.

     \verb|\LT@foot||_{24} \verb|\newbox|\LT@firsthead|
 \LT@lastfoot 25 \newbox\LT@foot
                26 \newbox\LT@lastfoot
      \LT@cols Counter for number of columns.
                27 \newcount\LT@cols
     \LT@rows Counter for rows up to chunksize.
                28 \newcount\LT@rows
 \c@LT@tables
               Counter for the tables, added in V3.02. Previous versions just used the LATEX
                counter table, but this fails if table is reset during a document, eg report class
                resets it every chapter.
                   This was changed from \newcount\LT@tables in V3.04. LATEX counters are
                preserved correctly when \includeonly is used. In the rest of the file \LT@tables
                has been replaced by \c@LT@tables without further comment.
                29 \newcounter{LT@tables}
               We need to count through the chunks of our tables from Version 4 on.
 \c@LT@chunks
                30 \newcounter{LT@chunks}[LT@tables]
     \cotable If the table counter is not defined (eg in letter style), define it. (Added in
   \fnum@table V3.06.)
    \tablename
               31 \ifx\c@table\undefined
                32 \newcounter{table}
                33 \def\fnum@table{\tablename~\thetable}
                34 \fi
                35 \ifx\tablename\undefined
                36 \def\tablename{Table}
                37\fi
               In a normal style, longtable uses the .aux file to record the column widths. With
                letter.sty, use a separate .1ta file. (Added in V3.06.)
                   Not needed for new letter class.

- 114 \advance\dimen@ \ht\LT@foot

..... Page 15

```
..... longtable.sty ............
               At this point I used to add \ht\@arstrutbox and \dp\@arstrutbox as a measure
               of a row size. However this can fail spectacularly for p columns which might be
               much larger. Previous versions could end up with the table starting with a foot,
               then a page break then a head then a 'first head'! So now measure the first line
               of the table accurately by \vsplitting it out of the first chunk.

..... Page 16

```
...... longtable.sty ..........
```

Since Version 3.02, longtable has used the internal counter \color color tables rather than the LATEX counter table. This information looks entirely different from version 3 information. Still, we don't need to rename the macro name because later code will consider the information to have no columns, and thus will throw the old data away.

```
147 \gdef\expandafter\noexpand
148 \csname LT@\romannumeral\c@LT@tables\endcsname
149 \{\LT@save@row}}}%
150 \fi
```

At this point used to issue a warning if a \multicolumn has been set in draft mode.

\LT@mcw@rn

If the last chunk has different widths than the first, warn the user. Also trigger a warning to rerun IATEX at the end of the document.

Force one more go with the longtable output routine.

```
157 \endgraf\penalty -\LT@end@pen
```

Now close the group to return to the standard routine.

```
158 \endgroup
```

Reset \@mparbottom to allow marginpars close to the end of the table.⁵

```
159 \global\@mparbottom\z@
```

160 \pagegoal\vsize

 $\verb|l61 \endgraf\penalty\z@\addvspace\LTpost|$

Footnotes. As done in the multicol package.

162 \ifvoid\footins\else\insert\footins{}\fi}

9.6 Counting Columns

Columns are counted by examining \@preamble, rather than simply getting \@mkpream to increment the counter as it builds the preamble so that this package works with many of the packages which add extra column specifiers to LATEX's standard ones.

Version 1 counted \@sharp's to calculate the number of columns, this was changed for Version 2 as it does not work with the NFSS. Now count &'s. (lfonts.new (and now the Standard IATEX definition) defines \@tabclassz so that \@sharp is inside a group.)

\LT@nofcols Find the next &, then look ahead to see what is next.

```
163 \def\LT@nofcols#1&{\%
```

164 \futurelet\@let@token\LT@n@fcols}

..... Page 17

⁵This can not be the correct. However if it is omitted, there is a problem with marginpars, for example on page 3 of this document. Any Output Routine Gurus out there?

```
...... longtable.sty .........
     \LT@n@fcols
                  Add one, then stop at an \LT@nofcols or look for the next &. The \expandafter
                  trick was added in Version 3, also the name changed from \QLT@nofcols to pre-
                  serve the \LT@ naming convention.
                  165 \def\LT@n@fcols{%
                      \advance\LT@cols\@ne
                       \ifx\@let@token\LT@nofcols
                         \expandafter\@gobble
                  168
                  169
                         \expandafter\LT@nofcols
                  170
                      \fi}
                  171
                  9.7
                         The \\ and \kill Commands
                  The internal definition of \\. In the * form, insert a \nobreak after the next \cr
   \LT@tabularcr
                  (or \crcr).
                      This star form processing was finally added in v4.05. For the previous six or
                  seven years the comment at this point said
                        This definition also accepts \\*, which acts in the same way as \\. tabular
                        does this, but longtable probably ought to make \\* prevent page breaking.
                      {\ifnum0='}\fi added in version 3.01, required if the first entry is empty.
                  The above in fact is not good enough, as with array package it can introduce a
                  {} group in math mode, which changes the spacing. So use the following variant.
                  Added in v3.14.
                 172 \def\LT@tabularcr{%

                      \crcr\LT@save@row\cr\egroup
                      \global\setbox\@ne\lastbox
                  The following line was added in v4.05. longtable relies on \lineskip glue (which
                  is 0pt) to provide break points between each row so the table may be split into
                  pages.
                     Previous releases left the \lineskip glue at the end of each chunk that had
                  been added when the dummy row was added. There was no glue at the start
                  of the next chunk as TFX normally dooes not put \lineskip glue at the top of
                  a box. This meant that normally the chunks fitted together perfectly, however
                  \noalign material at a chunk boundary came before the first row of the next
                  chunk but after the lineskip glue at the end of this chunk. This is the wrong place,
                  e.g., it means even a \penalty10000 does not stop a break as the \lineskip glue
                  in the previous item on the list provides a legal breakpoint. So now remove the
                  \lineskip glue that was before the dummy row and introduce \LT@setprevdepth
                  to set the \prevdepth at the start of the next chunk, to make sure \lineskip
                  glue is added later.
                 215
                         \unskip

```

..... Page 19

```
We here give the 'basic' definition of \LTCentry, namely that used in alignment
      \LT@entry
                 templates. It has a \kern only if the maximum is imposed from a different chunk.
                 The \ifhmode test reveals the first entry, when we don't want to add an &.
                217 \def\LT@entry#1#2{%
                     \ifhmode\@firstofone{&}\fi\omit

                     \fi}
                222
                 This definition for the argument of \LTCsaveCrow is used to scrap all those maxima
 \LT@entry@chop
                 which could not be verified because they occur after the end of the table. This
                 can happen only if a table has been shortened (or the sequencing got mixed up)
                 since the previous run. Note that this is premature: the last chunk still is going
                 to be set, and with the chopped limits.
                223 \def\LT@entry@chop#1#2{%
                     \noexpand\LT@entry

                228
                229
                         fi}
                 To write an entry for the aux file, we use a slightly surprising definition which has
\LT@entry@write
                 the sole purpose of avoiding overfull lines (which might break TEX's limits when
                 reading the aux file, probably you'd need to have a few hundred columns before
                 this happened but...).
                230 \def\LT@entry@write{%
                     \noexpand\LT@entry^^J%
                231
                232
                     \@spaces}
                 This ends the current chunk as above, but strips off two rows, the 'dummy row'
       \I.T@kill
                 and the 'killed row' before starting the next chunk. Since V3.04, the old chunk is
                 reboxed at the start of the box containing the next chunk. This allows \kill to
                 be used in headers, which must be processed in a single box.
                233 \def\LT@kill{%
                234
                     \LT@echunk

                235
                     \expandafter\LT@rebox\LT@bchunk}
      \LT@rebox Drop the old chunk (box0) back at the top of the new chunk, removing the killed
                 row. This macro added at V3.04.
                237 \def\LT@rebox#1\bgroup{%
                     #1\bgroup
                238
                239
                     \unvbox\z@
                240
                     \unskip
                     \setbox\z@\lastbox}
                241
                 9.8
                        The Dummy Row
```

The dummy row is kept inside of the macro \LT@save@row.

..... Page 20

```
...... longtable.sty ..........
```

\LT@blank@row

Create a blank row if we are not using the info in the .aux file.

 $\verb|\LT@build@blank||_{242 \leq LT@blank@row{\%}|$

```
{\tt 243} \qquad {\tt \xdef\LT@save@row{\expandafter\LT@build@blank}}
```

244 \romannumeral\number\LT@cols 001 }}

Whoops! What's that supposed to be? A drop-in replacement for the first task of Appendix D in the TEXbook. The \romannumeral produces \LT@cols instances of m followed by i. The below macro then replaces the ms by appropriate entries.

```
245 \def\LT@build@blank#1{%

246 \if#1m%

247 \noexpand\LT@entry{1}{Opt}%

248 \expandafter\LT@build@blank

249 \fi}
```

\LT@make@row

Prior to version 4, by default did not use information in the .aux file but now we can define \LT@make@row to use the .aux file, even on the 'draft' passes.

```
250 \def\LT@make@row{%

251 \global\expandafter\let\expandafter\LT@save@row

252 \csname LT@\romannumeral\c@LT@tables\endcsname

253 \ifx\LT@save@row\relax

254 \LT@blank@row
```

Now a slightly difficult part comes. Before we decide making the template from the .aux file info we check that the number of fields has remained the same. If it hasn't, either the table format has changed, or we have the wrong table altogether. In both cases, we decide to better drop all gathered information and start over.

The expansion between !...! below will be empty if the number of \LT@entry macros including arguments in \LT@save@row is equal to \LT@cols. If it is not empty, we throw the row away and start from scratch.

```
255
256
       {\let\LT@entry\or
        \if!%
257
             \ifcase\expandafter\expandafter\LT@cols
258
             \expandafter\@gobble\LT@save@row
259
             \or
260
             \else
261
               \relax
262
             \fi
263
            ! %
264
265
         \else
266
           \aftergroup\LT@blank@row
         \fi}%
267
268
     \fi}
```

\setlongtables

Redefine \LT@make@row to use information in the .aux file, if there is a saved row for this table with the right number of columns.

Since Version 3.02, longtable has used the internal counter \color color tables rather than the LATEX counter table. The warning message was added at V3.04, as was the \global, to stop save-stack overflow.

Since Version 4.01 \setlongtables does nothing as it is not needed, but is defined as \relax for the benefit of old documents.

269 \let\setlongtables\relax

\LT@get@widths

This is the heart of longtable. If it were not for the table head and foot, this macro together with the modified \\ command would form the basis of quite a simple little package file for long tables. It is closely modelled on the \endvrulealign macro of appendix D of the T_EXbook.

```
270 \def\LT@get@widths{%
```

\global added at V3.04, to stop save-stack overflow.

Loop through the last row, discarding glue, and saving box widths. At V3.04 changed the scratch box to 2, as the new \kill requires that \box0 be preserved.

```
\setbox\tw@\hbox{%
271
272
       \unhbox\@ne
273
       \let\LT@old@row\LT@save@row
       \global\let\LT@save@row\@empty
274
275
       \count@\LT@cols
276
       \loop
277
         \unskip
         \setbox\tw@\lastbox
278
279
       \ifhbox\tw@
         \LT@def@row
         \advance\count@\m@ne
281
282
       \repeat}%
     \ifx\LT@@save@row\@undefined
```

Remember the widths if we are in the first chunk.

```
284
       \let\LT@@save@row\LT@save@row
285
```

\LT@def@row

Add a column to the dummy row. Name changed from \defLT@save@row in Version 3, to preserve the \LTC naming convention.

```
286 \def\LT@def@row{%
```

We start by picking the respective entry from our old row. These redefinitions of \LT@entry are local to the group started in \LT@get@widths.

```
\let\LT@entry\or
287
     \edef\@tempa{%
288
       \ifcase\expandafter\count@\LT@old@row
289
290
       \else
291
          {1}{0pt}%
292
       \fi}%
```

Now we tack the right combination in front of \LT@save@row:

```
293
     \let\LT@entry\relax
     \xdef\LT@save@row{%
294
295
       \LT@entry
296
       \expandafter\LT@max@sel\@tempa
       \LT@save@row}}
```

\LT@max@sel

And this is how to select the right combination. Note that we take the old maximum information only if the size does not change in either direction. If the size has grown, we of course have a new maximum. If the size has shrunk, the old maximum (which was explicitly not enforced because of being in the current chunk) is invalid, and we start with this chunk as the new size. Note that even in the case of equality we must use the $\text{the}\text{wd}\tw0$ construct instead of #2 because #2

```
..... Page 22 ...............
```

```
might be read in from the file, and so could have \catcode 11 versions of p and t
            in it which we want to be replaced by their 'proper' \catcode 12 versions.
            298 \def\LT@max@sel#1#2{%
                 { = wd tw0 }
            299
                    #1%
            300
            301
                  \else
                    \number\c@LT@chunks
            302
                  \fi}%
            303

                          The Output Routine
                 The method used here for interfacing a special purpose output routine to the
                 standard IATFX routine is lifted straight out of F. Mittelbach's multicol package.
     \LTCoutput Actually this is not so bad, with FM leading the way.
                349 \def\LT@output{%
                      \ifnum\outputpenalty <-\@Mi
                        \ifnum\outputpenalty > -\LT@end@pen
                 If this was a float or a marginpar we complain.
                          \LT@err{floats and marginpars not allowed in a longtable}\@ehc
                352
                 353
                        \else
                 We have reached the end of the table, on the scroll at least,
                354
                          \setbox\z@\vbox{\unvbox\@cclv}%
                 355
                          \ifdim \ht\LT@lastfoot>\ht\LT@foot
                 The last foot might not fit, so:<sup>7</sup>
                            \dimen@\pagegoal
                356
                            \advance\dimen@-\ht\LT@lastfoot
                 357
                358
                            \ifdim\dimen@<\ht\z@
                              \setbox\@cclv\vbox{\unvbox\z@\copy\LT@foot\vss}%
                 359
                    <sup>7</sup>An alternative would be to vsplit off a bit of the last chunk, so that the last page did not
                 just have head and foot sections, but it is hard to do this in a consistent manner.

..... longtable.sty

	9.13 The \multicolumn command
	Earlier versions needed a special 'draft' form of \multicolumn. This is not needed in version 4, and so these commands have been removed.
\LTmulticolumn	
\LT@mcwarn	
	9.14 Footnotes
	The standard \footnote command works in a c column, but we need to modify the definition in a p column to overcome the extra level of boxing. These macros are based on the array package, but should be OK for the standard tabular.
\LT@startpbox	Add extra code to switch the definition of \@footnotetext. 391 \def\LT@startpbox#1{% 392 \bgroup 393 \let\@footnotetext\LT@p@ftntext 394 \setlength\hsize{#1}% 395 \@arrayparboxrestore 396 \vrule \@height \ht\@arstrutbox \@width \z@}
\LT@endpbox	After the parbox is closed, expand \LT@p@ftn which will execute a series of \footnotetext[$\langle num \rangle$] { $\langle note \rangle$ } commands. After being lifted out of the parbox, they can migrate on their own from here. 397 \def\LT@endpbox{% 398 \@finalstrut\@arstrutbox 399 \egroup 400 \the\LT@p@ftn 401 \global\LT@p@ftn{}% 402 \hfil}
\LT@p@ftntext	Inside the 'p' column, just save up the footnote text in a token register. 403 \def\LT@p@ftntext#1{% 404 \edef\@tempa{\the\LT@p@ftn\noexpand\footnotetext[\the\c@footnote]}% 405 \global\LT@p@ftn\expandafter{\@tempa{#1}}}% 406 \langle /package \rangle
